CiOS Audio Core Debug Facility

Developer must implement an inherit class of Debugger to output debug messages.

```
class Debugger
{
public:

    explicit Debugger (void) ;
    virtual  Debugger (void) ;

    virtual void printf (const char * format,...) ;
    virtual const char * Error (CaError errorCode) ;

protected:

private:

} ;

void Debugger::printf(const char * format,...) ;
```

This function acts like regular good old printf in C.

```
const char * Debugger::Error(CaError errorCode) ;
```

This function returns string message of errorCode.
